Investment committee decision

Recommendation: Accept. Implement the proposed allocation subject to owner review and monitoring.

What can go wrong? Equity markets can fall together, stock/bond correlations can rise, and income may not cover inflation plus spending.

How bad could losses become? The specified scenarios quantify conditional losses. Historical crises and hypothetical shocks are examples, not maximum-loss bounds.

Scenario	Loss USD	Breaches policy
GFC	$483,323	False
COVID	$914,922	False
Rates 2022	$958,319	False
Hypothetical joint inflation shock	$1,621,961	False

How confident are we? Each allocation has its own sequential forecast tests; failures stay visible. Bootstrap intervals quantify part of estimation uncertainty. Prior development saw historical crises and the model-order choice is disclosed.

Checks C1-C5: {'C1': True, 'C2': True, 'C3': True, 'C4': True, 'C5': True}. The frozen adjustment order changes weights (A1), then the risk budget (A2). No missing validation can yield an Accept verdict.

Action: owner reviews the evidence, signs the investment judgement, confirms solo eligibility and deadline, then authorises any submission. Review at 10% drawdown/yellow; consider validated de-risking at 15%/red.

AI assisted code and communications. Independent human validation remains pending. This proposal is not an executed mandate.
